BIM 360 SOURCE CONNECTOR

Available source connectors for the Aiimi Insight Engine have been extended to other operational systems, like BIM 360. Data and information stored in BIM 360, such as CAD drawings detailing the design of operational business assets, can be searched and discovered within the Aiimi Insight Engine. This feature extends its breadth to build a virtual data mesh across the entire enterprise that ingests information from disparate source systems and repositories, surfacing it in one central place for a user.

MARKERS AND ALERTS

This feature enables users to place markers on data they are interested in, so they are automatically alerted by email when changes occur. For example, a user might be interested in certain types of data or events relating to a person, organisation, or asset. This tool removes the need for manual checks, as the user receives automated alerts to any changes every day or week.

1 of 4

CORRELATING SEARCH TERMS

When users perform a search, they are presented with suggested search terms that they may also want to explore. These terms are based on synonyms for the named person or organisation. For example, if a user searches for 'Tovicci Utilities', the abbreviation 'Tovicci' appears as a suggested search term. This allows users to more easily discover insights related to their original search terms.

PDF EXPORT OF DATA RECORDS

This feature enables users to export data records in PDF format. The user specifies data records for export, and the integrated Aspose software tool converts it into a PDF, with exported metadata and key value pairs (displayed in single and nested tables). Users can specify individual results for export that support the integrity of collected information to prepare a disclosure as evidence for investigative or compliance processes.

CONVERSION OF OFFICE DOCUMENTS TO PDF AT EXPORT

An extension to our PDF Export of Data Results/Records feature, this tool enables users to convert Office Documents, like Word and PowerPoint files, directly into PDF format. Users can now convert all information, including structured data sets, collected with the Aiimi Insight Engine, and consistently supply it as a PDF for disclosure or to support operational business processes.

PDF EXPORT OF NETWORK DIAGRAM VISUALISATION

In addition to exporting Data Records and Office Documents in PDF format, users can also export a Network Diagram Visualisation displaying relationships between data objects. For example, network connections between an individual and a company or between an asset and an operational site are visually displayed as diagrams within the Aiimi Insight Engine. Users can also export a Network Diagram Visualisation as a PDF to disclose valuable connected information for more informed decision-making and to support investigative or compliance processes.

LINKING DATA RECORDS

This feature enables users to link data objects/records during enrichment for subsequent viewing on the search and discovery user interface. This tool ingests linked data records from source systems for exposure through the user interface. For example, users can link a customer's name to a specific address or an employee's name to a specific company. These explicit links can then be viewed using the Network Diagram Visualisation tool. Discovering how different data sets/records are interlinked enables users to derive intelligence and insight, which are not always obvious using manual searches.

DATA RECORD VERSIONING

Also referred to as ‘evidential integrity’, Users can view different versions of a data record, and all changes made within the source system are automatically shown in the Aiimi Insight Engine. Supplying updated versions of data records reassures users that the information they are using is correct and high-quality, while up-to-date insights can be viewed to inform critical business decisions.

RESULTS DETAILS PAGE

When viewing search results, users are directed to a separate page within the Aiimi Insight Engine. This Results Details Page displays more information, such as key topic areas, phrases, short summaries, and other related documents or data records that the user may also wish to view. This added insight is intelligently derived from the contents of the search result, enabling users to decide on its relevancy and value. This feature extends the Aiimi Insight Engine’s existing search results capability, which shows the owner of each document, when it was created, and changed.

SEARCH ACCURACY ALGORITHM OPTIMISATIONS

Improving the accuracy and relevancy of search results is an iterative process, which is why Aiimi Labs research and test numerous algorithms to continually improve the Aiimi Insight Engine. In Tokyo, a key enhancement applies natural language processing to interpret a user’s search terms more effectively. For example, when a user inputs a statement, question, or specific document related to their search query, natural language terms are directly matched up, boosting the search results. This means that users do not always need to know exactly what they are trying to find, but seamlessly discover the information they need to do their job.

NETWORK DIAGRAM VISUALISATION

By linking entities referenced in diverse data records, the Network Diagram Visualisation feature enables users to view and navigate interconnections to further refine their search. It also helps users unlock intelligent insight about why and how those data records are linked, more explicitly exposing relationships than shown in a linear format or within the native source system.

For example, a user can view an invoice alongside interlinked customers or projects. Or a user searching for a specific person can view affiliated departments or organisations to glean potentially criminal or non-compliant activity. This tool aids investigative decision-making. It also helps create a data mesh linking relationships from numerous disparate source systems across the entire enterprise.

DELETE THUMBNAILS FOR DELETED DOCUMENTS

When documents are deleted from the Aiimi Insight Engine index, the document thumbnail is also removed. This automated redundant thumbnail clean-up feature helps organisations allocate and optimise platform storage to reduce costs and free up space for other purposes.

DELETE THUMBNAIL INPUT/OUTPUT FOLDER FOR DELETED SOURCES

When a source system is removed or no longer crawled by the Aiimi Insight Engine, all previously generated thumbnails and preview caches for files stored in that system are automatically removed. By controlling thumbnail storage levels, organisations reduce costs and free up space for other purposes.

COLLECTION EXPORT

- **Export Office Docs to PDF:** Despite being supported by Aspose, **Visio** file types cannot be selected for export as PDFs within the **Export Collection** modal.
- **PUB Docs:** Missing content after PDF conversion.

MOBILE VIEW

- **Network Diagram: Actions banner** does not expand or collapse when the arrow is clicked, but this does not affect the overall functionality of the Network Diagram from being signed off. To **reproduce**, in mobile view, go to the Network Diagram, scroll down to the bottom of the mobile page, and tap the Actions banner specifically on the arrow/chevron. The Actions panel (showing Share) should pop up – this is what happens if the user clicks anywhere else on the banner – but instead the banner turns pink and doesn't expand.

COLLECTIONS DETAILS PAGE

- **Filtering:** After filtering **collection results**, all pre-selected results are cleared. If a user wants to locate several files for export using different unrelated search criteria, this breaks the use case.
