Data Result Redaction (Aspose PDF Conversion)

This feature allows users to preview and redact values on data results using PDFTron. When users select an item for preview, the data results are automatically converted into a PDF using Aspose PDF Conversion. This means users can preview and carry out redactions in PDFTron.

This feature helps us move even closer to our vision of treating data and content as one and the same thing within the Aiimi Insight Engine, ensuring all product functionality apply to both. Users can now perform redaction on Microsoft Office files, such as Word documents, and structured data records stored in corporate databases. This helps users responding to Data Subject Access Requests (DSARs) under the GDPR (General Data Protection Regulation), who need to collate all types of information referencing the data subject (e.g., corporate data records and files on employees or customers), and then redact any third-party information. This feature ensures no information is missed before disclosure.

Email Redaction (Aspose PDF Conversion)

This feature allows users to preview and redact text from emails surfaced within the Aiimi Insight Engine using PDFTron. When users select an item for preview, the data results are automatically converted into a PDF using Aspose PDF Conversion. This means users can preview and carry out redactions in PDFTron.

When many organisations respond to either customer or employee Data Subject Access Requests (DSARs) under the GDPR, a large volume of that information is often stored in emails. So, it's important that users can discover, collate, redact, and disclose data in emails as easily as they can for Microsoft Office files, such as Word documents, and corporate data records. This feature ensures no information is missed, helping to maintain integrity of the disclosure process.

Connectors

Deploying the Aiimi Insight Engine within Microsoft Outlook, Teams, and SharePoint to maximise the reach of your enterprise.

ODBC Source Connector 1.0

ODBC technology makes it possible for the Aiimi Insight Engine to carry out a generic approach to crawling and enriching data from database systems, such as SQL Server, MySQL, Oracle RDBMS, and BigQuery. This latest version makes it possible to index and enrich top-level data models stored in databases, such as viewing a list of organisations. Looking ahead, this will be extended to support sub-models so, for example, you can view employees working at a selected company.

This facilitates an automated and direct approach to crawling and ingesting data from these types of sources, making sure deltas (i.e., changes made to the data in the underlying system) are always captured and surface in Aiimi Insight Engine. This feature also saves system administrators from exporting and loading data from these systems into Aiimi Insight Engine, which is a resource intensive process and means ingestion is not a continuous process, but instead a manual one.

Essential Maintenance.

Control Hub Experience

Delivering a user-centric self-service experience for your Aiimi Insight Engine administrators.

Application Index Visibility Settings Update

Our Application Visibility Settings are being updated to make them simpler and clearer to use now that our Search, Manage, and DSAR solutions have been added to the core Aiimi Insight Engine application to improve the intuitive experience. Previously, when administrators configured specific sources for availability across our Search, Manage, and DSAR solutions, the labels used were out of date.

When configuring specific sources for our Search, Manage, and DSAR solutions, administrators can now do this with greater ease, confidence, and trust, knowing that the settings are being correctly applied. The language used in this Control Hub setting has also been updated to make it more user friendly.

Essential Maintenance.

Search & Navigation

Enabling users to search and consume information more intuitively, as part of our commitment to create an industry-leading product.

Commenting on a Collection

Users can now add comments to any collections they've created in the Search and DSAR solutions of the Aiimi Insight Engine. These comments can also be exported. If, for example, a collection of information is needed as supporting evidence for a disclosure process, this feature would prove especially useful.

The change is beneficial because it enables users to create and share collections to collaborate more directly with colleagues who may be working on the same projects or carrying out regular business procedures. By encouraging more conversation to take place on and around insights stored within the collection, users benefit from additional context – what's been added, removed, or why something's useful – preventing these insights from becoming lost in systems like email and Slack.

Essential Maintenance.

Essential Maintenance

Future-proofing our core industry-leading Aiimi Insight Engine product.

Angular Upgrade

We've upgraded to the latest version of Angular, Angular Version 12. This essential platform maintenance helps us to continue to meet the software standards needed to develop the Aiimi Insight Engine's features and functions.

Daily, Weekly, Monthly KPI Chart Filters

In Search, users can now view search performance and user adoption KPI charts according to day, week, month, and working hours. Previously, KPI charts were fixed to weekly or monthly depending on the settings applied by the administrator in Control Hub. Now, users can view more granular KPIs, for a far more accurate overview of the service's performance and how widely it's being adopted by other users.

Crucially, platform owners and administrators can now spot near real-time degradations in service performance, spot trends over time, and prevent potential issues.

Average Search Performance KPI Chart

Alongside the existing 90th percentile search performance KPI, users can now view average search performance according to day, week, or month. In addition, they can view this KPI on according to working hours, and a generic 24-hour period, to enable these factors to influence service performance.

This will enable platform administrators, owners, and interested users to view insights on the quality and speed of the service, so they can monitor near real-time performance more accurately and spot trends over time, ensuring any degradation in performance is more proactively addressed and prevented.
